GORKHA LINER™

देश कि ताकत

Gorkha Liner geomembranes are universal liners produced from premium virgin resin with carbon black and antioxidant stabilisation. They provide a durable, chemically resistant barrier for critical containment applications from landfills and mining to water management and aqua culture. Gorkha Liners supplied in smooth and textured finishes, in thicknesses from 0.5 mm to 1.5 mm.

Unlike traditional lining methods such as compacted clay, concrete or bitumen, an HDPE geomembrane forms a continuous, factory controlled barrier whose properties do not depend on site soil conditions or workmanship variability. Panels are joined on site by thermal fusion welding, producing seams that are as strong as the parent material. Our products are supplied in 12 Feet roll form or in welded seam forms as per customer requirements.

Outstanding chemical resistance to acids, alkalis, salts and leachates. Very low permeability. reliable long-term barrier against seepage. UV and weather resistant for exposed applications. High tensile strength, tear and puncture resistance, Good stress crack resistance for design lives of 5 to 10+ years. Fast and reliable seaming by hot-wedge and extrusion welding. Manufacturing facilities complies with ISO facilities
